

# Solutions to DSA Questions 51-80 (Linked Lists, Stacks, Queues, Trees)

For 1-2 Years Experience Roles at EPAM Compiled on September 26, 2025

## Introduction

This document provides detailed solutions for 30 Data Structures and Algorithms (DSA) problems (questions 51 to 80) from the Linked Lists, Stacks, Queues, and Trees categories, tailored for candidates with 1-2 years of experience preparing for roles at EPAM Systems. Each problem includes a problem statement, dry run with test cases, algorithm, and a Python solution, formatted for clarity. Dynamic programming problems include both memoization and tabulation approaches where applicable.

# 1 Add Two Numbers as Linked Lists

## 1.1 Problem Statement

Given two non-empty linked lists representing non-negative integers (digits in reverse order), add them and return the sum as a linked list.

## 1.2 Dry Run on Test Cases

- **Test Case 1:** l1 = 2->4->3, l2 = 5->6->4 → Output: 7->0->8 ( $342 + 465 = 807$ )
- **Test Case 2:** l1 = 0, l2 = 0 → Output: 0
- **Test Case 3:** l1 = 9->9->9, l2 = 1 → Output: 0->0->0->1
- **Test Case 4:** l1 = 1->8, l2 = 0 → Output: 1->8

## 1.3 Algorithm

1. Initialize dummy node and current pointer.
2. Traverse both lists, adding digits and carry.
3. Create new nodes for sum digits, handle carry.
4. Return dummy.next.

**Time Complexity:**  $O(\max(n, m))$     **Space Complexity:**  $O(\max(n, m))$

## 1.4 Python Solution

```
1 class ListNode:
2     def __init__(self, val=0, next=None):
3         self.val = val
4         self.next = next
5
6     def add_two_numbers(l1, l2):
7         dummy = ListNode(0)
8         curr = dummy
9         carry = 0
10
11        while l1 or l2 or carry:
12            x = l1.val if l1 else 0
13            y = l2.val if l2 else 0
14            total = x + y + carry
15            carry = total // 10
16            curr.next = ListNode(total % 10)
17            curr = curr.next
18            l1 = l1.next if l1 else None
19            l2 = l2.next if l2 else None
```

```
20     return dummy.next
```

## 2 Intersection of Two Linked Lists

### 2.1 Problem Statement

Given two linked lists, find the node where they intersect (same reference) or return None.

### 2.2 Dry Run on Test Cases

- **Test Case 1:** l1 = 4->1->(8->4->5), l2 = 5->6->1->(8->4->5) → Output: Node 8
- **Test Case 2:** l1 = 1->2, l2 = 3->4 → Output: None
- **Test Case 3:** l1 = None, l2 = 1 → Output: None
- **Test Case 4:** l1 = 1->2->3, l2 = 3 → Output: Node 3

### 2.3 Algorithm

1. Traverse both lists, switching to other list when reaching end.
2. If pointers meet, that's the intersection.
3. If both reach None, no intersection.

**Time Complexity:**  $O(n + m)$     **Space Complexity:**  $O(1)$

### 2.4 Python Solution

```
1 def get_intersection_node(headA, headB):
2     if not headA or not headB:
3         return None
4
5     a, b = headA, headB
6     while a != b:
7         a = a.next if a else headB
8         b = b.next if b else headA
9     return a
```

## 3 Reverse Nodes in k-Group

### 3.1 Problem Statement

Given a linked list, reverse every k nodes and return the new head.

## 3.2 Dry Run on Test Cases

- **Test Case 1:** head = 1->2->3->4->5, k = 2 → Output: 2->1->4->3->5
- **Test Case 2:** head = 1->2->3->4->5, k = 3 → Output: 3->2->1->4->5
- **Test Case 3:** head = 1, k = 1 → Output: 1
- **Test Case 4:** head = None, k = 2 → Output: None

## 3.3 Algorithm

1. Check if k nodes exist.
2. Reverse k nodes using iterative reversal.
3. Recursively process next k-group.

**Time Complexity:**  $O(n)$    **Space Complexity:**  $O(1)$  or  $O(n/k)$  for recursion

## 3.4 Python Solution

```
1 def reverse_k_group(head, k):
2     def get_kth(curr, k):
3         while curr and k > 0:
4             curr = curr.next
5             k -= 1
6         return curr
7
8     dummy = ListNode(0, head)
9     prev_group = dummy
10
11    while head:
12        kth = get_kth(head, k - 1)
13        if not kth:
14            break
15        next_group = kth.next
16        kth.next = None
17
18        # Reverse current group
19        prev = next_group
20        curr = head
21        while curr:
22            next_node = curr.next
23            curr.next = prev
24            prev = curr
25            curr = next_node
26
27        # Connect to previous group
28        prev_group.next = prev
29        prev_group = head
30        head = next_group
```

```
31     return dummy.next
32
```

## 4 Palindrome Linked List

### 4.1 Problem Statement

Given a linked list, determine if it is a palindrome.

### 4.2 Dry Run on Test Cases

- **Test Case 1:** head = 1->2->2->1 → Output: True
- **Test Case 2:** head = 1->2 → Output: False
- **Test Case 3:** head = 1 → Output: True
- **Test Case 4:** head = None → Output: True

### 4.3 Algorithm

1. Find middle using slow and fast pointers.
2. Reverse second half.
3. Compare first and second halves.

Time Complexity:  $O(n)$  Space Complexity:  $O(1)$

### 4.4 Python Solution

```
1 def is_palindrome(head):
2     if not head or not head.next:
3         return True
4
5     # Find middle
6     slow = fast = head
7     while fast.next and fast.next.next:
8         slow = slow.next
9         fast = fast.next.next
10
11    # Reverse second half
12    second_half = slow.next
13    slow.next = None
14    prev = None
15    while second_half:
16        next_node = second_half.next
17        second_half.next = prev
18        prev = second_half
19        second_half = next_node
```

```

20
21     # Compare
22     first_half = head
23     while prev:
24         if first_half.val != prev.val:
25             return False
26         first_half = first_half.next
27         prev = prev.next
28     return True

```

## 5 Remove Linked List Elements

### 5.1 Problem Statement

Given a linked list and a value, remove all nodes with that value.

### 5.2 Dry Run on Test Cases

- **Test Case 1:** head = 1->2->6->3->4->6, val = 6 → Output: 1->2->3->4
- **Test Case 2:** head = None, val = 1 → Output: None
- **Test Case 3:** head = 7->7->7, val = 7 → Output: None
- **Test Case 4:** head = 1, val = 2 → Output: 1

### 5.3 Algorithm

1. Use dummy node to handle head removal.
2. Traverse list, skip nodes with given value.
3. Return dummy.next.

**Time Complexity:**  $O(n)$     **Space Complexity:**  $O(1)$

### 5.4 Python Solution

```

1 def remove_elements(head, val):
2     dummy = ListNode(0, head)
3     curr = dummy
4
5     while curr.next:
6         if curr.next.val == val:
7             curr.next = curr.next.next
8         else:
9             curr = curr.next
10    return dummy.next

```

## 6 Swap Nodes in Pairs

### 6.1 Problem Statement

Given a linked list, swap every two adjacent nodes and return the head.

### 6.2 Dry Run on Test Cases

- **Test Case 1:** head = 1->2->3->4 → Output: 2->1->4->3
- **Test Case 2:** head = 1 → Output: 1
- **Test Case 3:** head = None → Output: None
- **Test Case 4:** head = 1->2->3 → Output: 2->1->3

### 6.3 Algorithm

1. If less than 2 nodes, return head.
2. Swap current pair, recursively swap rest.
3. Adjust pointers to connect swapped pairs.

**Time Complexity:**  $O(n)$    **Space Complexity:**  $O(n)$  for recursion

### 6.4 Python Solution

```
1 def swap_pairs(head):
2     if not head or not head.next:
3         return head
4
5     next_node = head.next
6     head.next = swap_pairs(next_node.next)
7     next_node.next = head
8     return next_node
```

## 7 Odd Even Linked List

### 7.1 Problem Statement

Given a linked list, group odd-indexed nodes together followed by even-indexed nodes.

### 7.2 Dry Run on Test Cases

- **Test Case 1:** head = 1->2->3->4->5 → Output: 1->3->5->2->4
- **Test Case 2:** head = 2->1->3->5->6->4->7 → Output: 2->3->6->7->1->5->4
- **Test Case 3:** head = 1 → Output: 1

- **Test Case 4:** head = None → Output: None

### 7.3 Algorithm

1. Maintain odd and even pointers.
2. Link odd nodes together, even nodes together.
3. Connect odd list to even list.

**Time Complexity:**  $O(n)$    **Space Complexity:**  $O(1)$

### 7.4 Python Solution

```

1 def odd_even_list(head):
2     if not head or not head.next:
3         return head
4
5     odd = head
6     even = head.next
7     even_head = even
8
9     while even and even.next:
10        odd.next = even.next
11        odd = odd.next
12        even.next = odd.next
13        even = even.next
14
15    odd.next = even_head
16    return head

```

## 8 Partition List

### 8.1 Problem Statement

Given a linked list and value x, partition list so all nodes less than x come before nodes greater than or equal to x.

### 8.2 Dry Run on Test Cases

- **Test Case 1:** head = 1->4->3->2->5->2, x = 3 → Output: 1->2->2->4->3->5
- **Test Case 2:** head = 2->1, x = 2 → Output: 1->2
- **Test Case 3:** head = None, x = 0 → Output: None
- **Test Case 4:** head = 1, x = 2 → Output: 1

## 8.3 Algorithm

1. Maintain two lists: less and greater.
2. Traverse list, append nodes to appropriate list.
3. Connect less to greater.

**Time Complexity:**  $O(n)$    **Space Complexity:**  $O(1)$

## 8.4 Python Solution

```
1 def partition(head, x):
2     less_dummy = ListNode(0)
3     greater_dummy = ListNode(0)
4     less = less_dummy
5     greater = greater_dummy
6
7     curr = head
8     while curr:
9         if curr.val < x:
10             less.next = curr
11             less = less.next
12         else:
13             greater.next = curr
14             greater = greater.next
15         curr = curr.next
16
17     greater.next = None
18     less.next = greater_dummy.next
19     return less_dummy.next
```

# 9 Rotate List

## 9.1 Problem Statement

Given a linked list, rotate it to the right by k places.

## 9.2 Dry Run on Test Cases

- **Test Case 1:** head = 1->2->3->4->5, k = 2 → Output: 4->5->1->2->3
- **Test Case 2:** head = 0->1->2, k = 4 → Output: 2->0->1
- **Test Case 3:** head = 1, k = 1 → Output: 1
- **Test Case 4:** head = None, k = 1 → Output: None

## 9.3 Algorithm

1. Find length and last node.

2. Compute effective  $k = k \% \text{length}$ .
3. Find new tail ( $\text{length} - k - 1$ ), set next to None, connect last to head.

**Time Complexity:**  $O(n)$    **Space Complexity:**  $O(1)$

## 9.4 Python Solution

```

1 def rotate_right(head, k):
2     if not head or not head.next or k == 0:
3         return head
4
5     # Find length and last node
6     length = 1
7     last = head
8     while last.next:
9         last = last.next
10        length += 1
11
12    k = k % length
13    if k == 0:
14        return head
15
16    # Find new tail
17    new_tail = head
18    for _ in range(length - k - 1):
19        new_tail = new_tail.next
20
21    new_head = new_tail.next
22    new_tail.next = None
23    last.next = head
24    return new_head

```

# 10 Reorder List

## 10.1 Problem Statement

Given a linked list  $L_0 \rightarrow L_1 \rightarrow \dots \rightarrow L_{n-1} \rightarrow L_n$ , reorder it to  $L_0 \rightarrow L_n \rightarrow L_1 \rightarrow L_{n-1} \rightarrow \dots$

## 10.2 Dry Run on Test Cases

- **Test Case 1:**  $\text{head} = 1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow \dots$  → Output:  $1 \rightarrow 4 \rightarrow 2 \rightarrow 3 \rightarrow \dots$
- **Test Case 2:**  $\text{head} = 1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow \dots$  → Output:  $1 \rightarrow 5 \rightarrow 2 \rightarrow 4 \rightarrow 3 \rightarrow \dots$
- **Test Case 3:**  $\text{head} = 1 \rightarrow \dots$  → Output:  $1 \rightarrow \dots$
- **Test Case 4:**  $\text{head} = \text{None} \rightarrow \dots$  → Output:  $\text{None} \rightarrow \dots$

## 10.3 Algorithm

1. Find middle using slow and fast pointers.
2. Reverse second half.
3. Merge first and second halves alternately.

**Time Complexity:**  $O(n)$    **Space Complexity:**  $O(1)$

## 10.4 Python Solution

```
1 def reorder_list(head):
2     if not head or not head.next:
3         return
4
5     # Find middle
6     slow = fast = head
7     while fast.next and fast.next.next:
8         slow = slow.next
9         fast = fast.next.next
10
11    # Reverse second half
12    second = slow.next
13    slow.next = None
14    prev = None
15    while second:
16        next_node = second.next
17        second.next = prev
18        prev = second
19        second = next_node
20
21    # Merge
22    first = head
23    while prev:
24        next_first = first.next
25        next_prev = prev.next
26        first.next = prev
27        prev.next = next_first
28        first = next_first
29        prev = next_prev
```

## 11 Valid Number

### 11.1 Problem Statement

Given a string, determine if it is a valid number (integer, decimal, or scientific notation).

### 11.2 Dry Run on Test Cases

- **Test Case 1:** Input = "0" → Output: True

- **Test Case 2:** Input = "e" → Output: False
- **Test Case 3:** Input = "2e10" → Output: True
- **Test Case 4:** Input = "-0.1" → Output: True

### 11.3 Algorithm

1. Use regex or manual parsing to check:
  - Optional sign, digits, optional decimal, optional 'e' followed by integer.
2. Ensure proper format (e.g., no multiple decimals).

**Time Complexity:**  $O(n)$    **Space Complexity:**  $O(1)$

### 11.4 Python Solution

```

1 def is_number(s):
2     s = s.strip()
3     if not s:
4         return False
5
6     # Split on 'e' or 'E'
7     parts = s.lower().split('e')
8     if len(parts) > 2:
9         return False
10
11    # Validate base part
12    base = parts[0]
13    if not base or base == '+' or base == '-':
14        return False
15
16    decimal_count = 0
17    digit_seen = False
18    for i, char in enumerate(base):
19        if char == '.':
20            decimal_count += 1
21            if decimal_count > 1:
22                return False
23        elif char.isdigit():
24            digit_seen = True
25        elif char not in ['+', '-'] or i != 0:
26            return False
27
28    if not digit_seen:
29        return False
30
31    # Validate exponent if present
32    if len(parts) == 2:
33        exponent = parts[1]
34        if not exponent or exponent == '+' or exponent == '-':

```

```

35         return False
36     digit_seen = False
37     for i, char in enumerate(exponent):
38         if char.isdigit():
39             digit_seen = True
40         elif char not in ['+', '-'] or i != 0:
41             return False
42     if not digit_seen:
43         return False
44
45     return True
46
47 # Example usage
48 print(is_number("2e10")) # Output: True

```

## 12 Min Stack

### 12.1 Problem Statement

Design a stack that supports push, pop, top, and retrieving the minimum element in  $O(1)$  time.

### 12.2 Dry Run on Test Cases

- **Test Case 1:** push(3), push(5), getMin()  $\rightarrow$  3, push(2), getMin()  $\rightarrow$  2, pop(), getMin()  $\rightarrow$  3
- **Test Case 2:** push(1), pop(), top()  $\rightarrow$  None
- **Test Case 3:** push(2), push(1), getMin()  $\rightarrow$  1
- **Test Case 4:** empty stack, getMin()  $\rightarrow$  None

### 12.3 Algorithm

1. Use two stacks: one for values, one for minimums.
2. Push: append value, update min stack if needed.
3. Pop: remove from both stacks if popped value was min.
4. Top/GetMin: return top of respective stacks.

**Time Complexity:**  $O(1)$  for all operations    **Space Complexity:**  $O(n)$

### 12.4 Python Solution

```

1 class MinStack:
2     def __init__(self):
3         self.stack = []

```

```

4     self.min_stack = []
5
6     def push(self, val):
7         self.stack.append(val)
8         if not self.min_stack or val <= self.min_stack[-1]:
9             self.min_stack.append(val)
10
11    def pop(self):
12        if not self.stack:
13            return
14        val = self.stack.pop()
15        if val == self.min_stack[-1]:
16            self.min_stack.pop()
17
18    def top(self):
19        return self.stack[-1] if self.stack else None
20
21    def getMin(self):
22        return self.min_stack[-1] if self.min_stack else None
23
24 # Example usage
25 # minStack = MinStack()
26 # minStack.push(3)
27 # minStack.push(5)
28 # print(minStack.getMin()) # Output: 3

```

## 13 Evaluate Reverse Polish Notation

### 13.1 Problem Statement

Given an array of strings representing an RPN expression, evaluate it.

### 13.2 Dry Run on Test Cases

- **Test Case 1:** tokens = ["2", "1", "+", "3", "\*"] → Output: 9 ( $(2 + 1) * 3$ )
- **Test Case 2:** tokens = ["4", "13", "5", "/", "+"] → Output: 6 ( $4 + 13/5$ )
- **Test Case 3:** tokens = ["10"] → Output: 10
- **Test Case 4:** tokens = ["10", "6", "/"] → Output: 1

### 13.3 Algorithm

1. Use a stack to store operands.
2. For each token:
  - If number, push to stack.

- If operator, pop two operands, compute, push result.

3. Return stack top.

**Time Complexity:**  $O(n)$     **Space Complexity:**  $O(n)$

### 13.4 Python Solution

```

1 def eval_rpn(tokens):
2     stack = []
3     operators = {
4         '+': lambda x, y: x + y,
5         '-': lambda x, y: x - y,
6         '*': lambda x, y: x * y,
7         '/': lambda x, y: int(x / y)
8     }
9
10    for token in tokens:
11        if token in operators:
12            b = stack.pop()
13            a = stack.pop()
14            stack.append(operators[token](a, b))
15        else:
16            stack.append(int(token))
17    return stack[0]
18
19 # Example usage
20 print(eval_rpn(["2", "1", "+", "3", "*"])) # Output: 9

```

## 14 Valid Parentheses with Wildcard

### 14.1 Problem Statement

Given a string with '(', ')', and '\*', where '\*' can be '(', ')', or empty, check if valid.

### 14.2 Dry Run on Test Cases

- **Test Case 1:**  $s = "() \rightarrow \text{Output: True}$
- **Test Case 2:**  $s = "(*" \rightarrow \text{Output: True}$
- **Test Case 3:**  $s = "(*))" \rightarrow \text{Output: True}$
- **Test Case 4:**  $s = "((*)" \rightarrow \text{Output: True}$

### 14.3 Algorithm

1. Track min and max open brackets (min can be 0, max can increase with \*).
2. For each char:

- '(': min++, max++
- ')': min--, max--
- '\*': min--, max++

3. Ensure  $\text{min} \geq 0$ , reset  $\text{min}$  to 0 if negative.

4. Return True if  $\text{min} == 0$  at end.

**Time Complexity:**  $O(n)$     **Space Complexity:**  $O(1)$

## 14.4 Python Solution

```

1 def check_valid_string(s):
2     min_open = max_open = 0
3
4     for char in s:
5         if char == '(':
6             min_open += 1
7             max_open += 1
8         elif char == ')':
9             min_open -= 1
10            max_open -= 1
11        else: # '*'
12            min_open -= 1
13            max_open += 1
14        if max_open < 0:
15            return False
16        if min_open < 0:
17            min_open = 0
18    return min_open == 0
19
20 # Example usage
21 print(check_valid_string("(*)")) # Output: True

```

## 15 Next Greater Element

### 15.1 Problem Statement

Given two arrays  $\text{nums1}$  and  $\text{nums2}$ , for each element in  $\text{nums1}$ , find the next greater element in  $\text{nums2}$ .

### 15.2 Dry Run on Test Cases

- **Test Case 1:**  $\text{nums1} = [4,1,2]$ ,  $\text{nums2} = [1,3,4,2] \rightarrow \text{Output: } [-1,3,-1]$
- **Test Case 2:**  $\text{nums1} = [2,4]$ ,  $\text{nums2} = [1,2,3,4] \rightarrow \text{Output: } [3,-1]$
- **Test Case 3:**  $\text{nums1} = [1]$ ,  $\text{nums2} = [1] \rightarrow \text{Output: } [-1]$

- **Test Case 4:**  $\text{nums1} = []$ ,  $\text{nums2} = [1,2] \rightarrow \text{Output: } []$

### 15.3 Algorithm

1. Use stack to find next greater for each element in  $\text{nums2}$ .
2. Store results in hashmap.
3. Map  $\text{nums1}$  elements to their next greater.

**Time Complexity:**  $O(n)$     **Space Complexity:**  $O(n)$

### 15.4 Python Solution

```

1 def next_greater_element(nums1, nums2):
2     stack = []
3     next_greater = {}
4
5     for num in nums2:
6         while stack and stack[-1] < num:
7             next_greater[stack.pop()] = num
8             stack.append(num)
9
10    while stack:
11        next_greater[stack.pop()] = -1
12
13    return [next_greater[num] for num in nums1]
14
15 # Example usage
16 print(next_greater_element([4,1,2], [1,3,4,2])) # Output:
17      [-1,3,-1]
```

## 16 Daily Temperatures

### 16.1 Problem Statement

Given an array of temperatures, return an array where each element is the number of days until a warmer day.

### 16.2 Dry Run on Test Cases

- **Test Case 1:**  $\text{temperatures} = [73,74,75,71,69,72,76,73] \rightarrow \text{Output: } [1,1,4,2,1,1,0,0]$
- **Test Case 2:**  $\text{temperatures} = [30,40,50,60] \rightarrow \text{Output: } [1,1,1,0]$
- **Test Case 3:**  $\text{temperatures} = [30] \rightarrow \text{Output: } [0]$
- **Test Case 4:**  $\text{temperatures} = [30,20,10] \rightarrow \text{Output: } [0,0,0]$

## 16.3 Algorithm

1. Use stack to store indices of temperatures.
2. For each temperature, pop stack while current > stack top, calculate days.
3. Push current index to stack.

**Time Complexity:**  $O(n)$    **Space Complexity:**  $O(n)$

## 16.4 Python Solution

```
1 def daily_temperatures(temperatures):
2     n = len(temperatures)
3     result = [0] * n
4     stack = []
5
6     for i in range(n):
7         while stack and temperatures[i] > temperatures[stack
8             [-1]]:
9             prev = stack.pop()
10            result[prev] = i - prev
11            stack.append(i)
12
13    return result
14
15 # Example usage
16 print(daily_temperatures([73,74,75,71,69,72,76,73])) # Output:
17     [1,1,4,2,1,1,0,0]
```

## 17 Implement Stack Using Queues

### 17.1 Problem Statement

Implement a stack using two queues with push, pop, top, and empty operations.

### 17.2 Dry Run on Test Cases

- **Test Case 1:** push(1), push(2), top() → 2, pop() → 2, empty() → False
- **Test Case 2:** push(1), pop(), empty() → True
- **Test Case 3:** empty() → True
- **Test Case 4:** push(1), top() → 1

### 17.3 Algorithm

1. Use two queues; main queue holds stack elements.
2. Push: add to main queue.

3. Pop/Top: move all but last element to second queue, process last, swap queues.

**Time Complexity:**  $O(n)$  for pop/top,  $O(1)$  for push/empty    **Space Complexity:**  $O(n)$

## 17.4 Python Solution

```

1  from collections import deque
2
3  class MyStack:
4      def __init__(self):
5          self.q1 = deque()
6          self.q2 = deque()
7
8      def push(self, x):
9          self.q1.append(x)
10
11     def pop(self):
12         if not self.q1:
13             return None
14         while len(self.q1) > 1:
15             self.q2.append(self.q1.popleft())
16         result = self.q1.popleft()
17         self.q1, self.q2 = self.q2, self.q1
18         return result
19
20     def top(self):
21         if not self.q1:
22             return None
23         while len(self.q1) > 1:
24             self.q2.append(self.q1.popleft())
25         result = self.q1[0]
26         self.q2.append(self.q1.popleft())
27         self.q1, self.q2 = self.q2, self.q1
28         return result
29
30     def empty(self):
31         return len(self.q1) == 0

```

## 18 Implement Queue Using Stacks

### 18.1 Problem Statement

Implement a queue using two stacks with enqueue, dequeue, peek, and empty operations.

### 18.2 Dry Run on Test Cases

- **Test Case 1:** enqueue(1), enqueue(2), peek() → 1, dequeue() → 1
- **Test Case 2:** enqueue(1), dequeue(), empty() → True

- **Test Case 3:** `empty()` → True
- **Test Case 4:** `enqueue(1)`, `peek()` → 1

### 18.3 Algorithm

1. Use two stacks: `push_stack` and `pop_stack`. *Enqueue : push to push\_stack.*
2. Dequeue/Peek: move `push_stack` to `pop_stack` if empty, `pop/peek` from `pop_stack`. **Time Complexity:**  $O(1)$  amortized for all operations   **Space Complexity:**  $O(n)$

### 18.4 Python Solution

```

1  class MyQueue:
2      def __init__(self):
3          self.push_stack = []
4          self.pop_stack = []
5
6      def push(self, x):
7          self.push_stack.append(x)
8
9      def pop(self):
10         if not self.pop_stack:
11             while self.push_stack:
12                 self.pop_stack.append(self.push_stack.pop())
13         return self.pop_stack.pop() if self.pop_stack else
14             None
15
16      def peek(self):
17         if not self.pop_stack:
18             while self.push_stack:
19                 self.pop_stack.append(self.push_stack.pop())
20         return self.pop_stack[-1] if self.pop_stack else None
21
22      def empty(self):
23          return not self.push_stack and not self.pop_stack

```

## 19 Design Circular Queue

### 19.1 Problem Statement

Design a circular queue with enqueue, dequeue, front, rear, isEmpty, and isFull operations.

### 19.2 Dry Run on Test Cases

- **Test Case 1:** k=3, enQueue(1), enQueue(2), enQueue(3), isFull() → True, deQueue() → 1
- **Test Case 2:** k=1, enQueue(1), deQueue(), isEmpty() → True

- **Test Case 3:**  $k=2$ , `enQueue(1)`, `Front()`  $\rightarrow 1$ , `Rear()`  $\rightarrow 1$
  - **Test Case 4:**  $k=1$ , `isEmpty()`  $\rightarrow$  True

### 19.3 Algorithm

1. Use array of size  $k$  with front and rear pointers.
  2. Enqueue: if not full, add at rear, increment rear  $\% k$ .
  3. Dequeue: if not empty, increment front  $\% k$ .
  4. Track size for empty/full checks.

**Time Complexity:**  $O(1)$  for all operations    **Space Complexity:**  $O(k)$

## 19.4 Python Solution

```
1 class MyCircularQueue:
2     def __init__(self, k):
3         self.size = k
4         self.queue = [None] * k
5         self.front = -1 # Index of front element
6         self.rear = -1 # Index of last element
7         self.count = 0 # Number of elements
8
9     def enqueue(self, value):
10        if self.isFull():
11            return False
12        if self.isEmpty():
13            self.front = 0
14        self.rear = (self.rear + 1) % self.size
15        self.queue[self.rear] = value
16        self.count += 1
17        return True
18
19    def dequeue(self):
20        if self.isEmpty():
21            return False
22        self.front = (self.front + 1) % self.size
23        self.count -= 1
24        if self.isEmpty():
25            self.front = -1
26            self.rear = -1
27        return True
28
29    def Front(self):
30        return self.queue[self.front] if not self.isEmpty()
31        () else -1
32
33    def Rear(self):
```

```

33         return self.queue[self.rear] if not self.isEmpty
34         () else -1
35
36     def isEmpty(self):
37         return self.count == 0
38
39     def isFull(self):
40         return self.count == self.size

```

## 20 Sliding Window Maximum

### 20.1 Problem Statement

Given an array and window size  $k$ , find the maximum element in each sliding window.

### 20.2 Dry Run on Test Cases

- \* **Test Case 1:**  $\text{nums} = [1,3,-1,-3,5,3,6,7]$ ,  $k = 3 \rightarrow \text{Output: } [3,3,5,5,6,7]$
- \* **Test Case 2:**  $\text{nums} = [1]$ ,  $k = 1 \rightarrow \text{Output: } [1]$
- \* **Test Case 3:**  $\text{nums} = [1,-1]$ ,  $k = 1 \rightarrow \text{Output: } [1,-1]$
- \* **Test Case 4:**  $\text{nums} = []$ ,  $k = 1 \rightarrow \text{Output: } []$

### 20.3 Algorithm

1. Use deque to store indices of potential max elements.
2. For each element:
  - Remove indices outside window.
  - Remove smaller elements from back.
  - Add current index.
3. After  $k$  elements, append max (front of deque) for each window.

**Time Complexity:**  $O(n)$     **Space Complexity:**  $O(k)$

### 20.4 Python Solution

```

1 from collections import deque
2
3 def max_sliding_window(nums, k):
4     if not nums or k == 0:
5         return []

```

```

7     result = []
8     deq = deque()
9
10    for i in range(len(nums)):
11        # Remove indices outside window
12        while deq and deq[0] <= i - k:
13            deq.popleft()
14        # Remove smaller elements
15        while deq and nums[deq[-1]] < nums[i]:
16            deq.pop()
17        deq.append(i)
18        # Add max for window
19        if i >= k - 1:
20            result.append(nums[deq[0]])
21    return result
22
23 # Example usage
24 print(max_sliding_window([1,3,-1,-3,5,3,6,7], 3)) # Output: [3,3,5,5,6,7]

```

## 21 Largest Rectangle in Histogram

### 21.1 Problem Statement

Given an array of bar heights, find the largest rectangle area in the histogram.

### 21.2 Dry Run on Test Cases

- **Test Case 1:** heights = [2,1,5,6,2,3] → Output: 10 (height 5, width 2)
- **Test Case 2:** heights = [2,4] → Output: 4
- **Test Case 3:** heights = [1] → Output: 1
- **Test Case 4:** heights = [] → Output: 0

### 21.3 Algorithm

1. Use stack to store indices of increasing heights.
2. For each bar, pop stack while current height < stack top height.
3. Calculate area for each popped bar: height \* (current index - previous index - 1).
4. Handle remaining bars after loop.

**Time Complexity:**  $O(n)$     **Space Complexity:**  $O(n)$

## 21.4 Python Solution

```
1 def largest_rectangle_area(heights):
2     stack = [-1]
3     max_area = 0
4     heights.append(0)    # Sentinel to process
5                     remaining bars
6
7     for i in range(len(heights)):
8         while stack[-1] != -1 and heights[i] <
9             heights[stack[-1]]:
10            h = heights[stack.pop()]
11            w = i - stack[-1] - 1
12            max_area = max(max_area, h * w)
13            stack.append(i)
14
15
16 # Example usage
17 print(largest_rectangle_area([2,1,5,6,2,3]))  #
18
19 Output: 10
```

## 22 Minimum Remove to Make Valid Parentheses

### 22.1 Problem Statement

Given a string with '(', ')', and letters, remove minimum characters to make it valid.

### 22.2 Dry Run on Test Cases

- **Test Case 1:** s = "lee(t(c)o)de" → Output: "lee(t(c)o)de"
- **Test Case 2:** s = "a)b(c)d" → Output: "ab(c)d"
- **Test Case 3:** s = "))()" → Output: ""
- **Test Case 4:** s = "(a(b(c)d)" → Output: "a(b(c)d)"

### 22.3 Algorithm

1. Use stack to track indices of open parentheses.
2. Mark invalid parentheses for removal.
3. Build result string, skipping marked indices.

**Time Complexity:**  $O(n)$    **Space Complexity:**  $O(n)$

## 22.4 Python Solution

```
1 def min_remove_to_make_valid(s):
2     s = list(s)
3     stack = []
4
5     # Mark invalid parentheses
6     for i, char in enumerate(s):
7         if char == '(':
8             stack.append(i)
9         elif char == ')':
10            if stack:
11                stack.pop()
12            else:
13                s[i] = ''
14
15     # Mark unmatched open parentheses
16     while stack:
17         s[stack.pop()] = ''
18
19     return ''.join(s)
20
21 # Example usage
22 print(min_remove_to_make_valid("lee(t(c)o)de")) # Output: "lee(t(c)o)de"
```

## 23 Binary Tree Inorder Traversal

### 23.1 Problem Statement

Given a binary tree, return its inorder traversal (left, root, right).

### 23.2 Dry Run on Test Cases

- **Test Case 1:** root = [1,null,2,3] → Output: [1,3,2]
- **Test Case 2:** root = [] → Output: []
- **Test Case 3:** root = [1] → Output: [1]
- **Test Case 4:** root = [1,2,3] → Output: [2,1,3]

### 23.3 Algorithm

1. Use iterative approach with stack.
2. Push all left nodes to stack.
3. Pop node, add to result, process right subtree.

Time Complexity:  $O(n)$  Space Complexity:  $O(h)$  ( $h$  = tree height)

## 23.4 Python Solution

```
1 class TreeNode:
2     def __init__(self, val=0, left=None, right=None):
3         self.val = val
4         self.left = left
5         self.right = right
6
7     def inorder_traversal(root):
8         result = []
9         stack = []
10        curr = root
11
12        while curr or stack:
13            while curr:
14                stack.append(curr)
15                curr = curr.left
16            curr = stack.pop()
17            result.append(curr.val)
18            curr = curr.right
19
20        return result
```

# 24 Binary Tree Preorder Traversal

## 24.1 Problem Statement

Given a binary tree, return its preorder traversal (root, left, right).

## 24.2 Dry Run on Test Cases

- **Test Case 1:** root = [1,null,2,3] → Output: [1,2,3]
- **Test Case 2:** root = [] → Output: []
- **Test Case 3:** root = [1] → Output: [1]
- **Test Case 4:** root = [1,2,3] → Output: [1,2,3]

## 24.3 Algorithm

1. Use iterative approach with stack.
2. Push root, pop and process node, push right then left (stack reverses order).

Time Complexity:  $O(n)$  Space Complexity:  $O(h)$

## 24.4 Python Solution

```
1 def preorder_traversal(root):
2     if not root:
3         return []
4
5     result = []
6     stack = [root]
7
8     while stack:
9         node = stack.pop()
10        result.append(node.val)
11        if node.right:
12            stack.append(node.right)
13        if node.left:
14            stack.append(node.left)
15    return result
```

# 25 Binary Tree Postorder Traversal

## 25.1 Problem Statement

Given a binary tree, return its postorder traversal (left, right, root).

## 25.2 Dry Run on Test Cases

- **Test Case 1:** root = [1,null,2,3] → Output: [3,2,1]
- **Test Case 2:** root = [] → Output: []
- **Test Case 3:** root = [1] → Output: [1]
- **Test Case 4:** root = [1,2,3] → Output: [2,3,1]

## 25.3 Algorithm

1. Use two stacks: first for preorder (root, left, right), second to reverse.
2. Pop from first stack, push to second, add children in reverse order.
3. Pop from second stack for result.

**Time Complexity:**  $O(n)$     **Space Complexity:**  $O(h)$

## 25.4 Python Solution

```
1 def postorder_traversal(root):
2     if not root:
3         return []
```

```

4     result = []
5     stack1 = [root]
6     stack2 = []
7
8     while stack1:
9         node = stack1.pop()
10        stack2.append(node)
11        if node.left:
12            stack1.append(node.left)
13        if node.right:
14            stack1.append(node.right)
15
16    while stack2:
17        result.append(stack2.pop().val)
18
19    return result

```

## 26 Binary Tree Level Order Traversal

### 26.1 Problem Statement

Given a binary tree, return its level order traversal (level by level, left to right).

### 26.2 Dry Run on Test Cases

- **Test Case 1:** root = [3,9,20,null,null,15,7] → Output: [[3],[9,20],[15,7]]
- **Test Case 2:** root = [1] → Output: [[1]]
- **Test Case 3:** root = [] → Output: []
- **Test Case 4:** root = [1,2,3] → Output: [[1],[2,3]]

### 26.3 Algorithm

1. Use queue to process nodes level by level.
2. For each level, process all nodes, add children to queue.
3. Collect nodes per level in result.

**Time Complexity:**  $O(n)$     **Space Complexity:**  $O(w)$  ( $w$  = max width)

### 26.4 Python Solution

```

1 from collections import deque
2
3 def level_order(root):

```

```

4     if not root:
5         return []
6
7     result = []
8     queue = deque([root])
9
10    while queue:
11        level_size = len(queue)
12        current_level = []
13        for _ in range(level_size):
14            node = queue.popleft()
15            current_level.append(node.val)
16            if node.left:
17                queue.append(node.left)
18            if node.right:
19                queue.append(node.right)
20        result.append(current_level)
21    return result

```

## 27 Maximum Depth of Binary Tree

### 27.1 Problem Statement

Given a binary tree, find its maximum depth (number of nodes along longest path from root to leaf).

### 27.2 Dry Run on Test Cases

- **Test Case 1:** root = [3,9,20,null,null,15,7] → Output: 3
- **Test Case 2:** root = [1,null,2] → Output: 2
- **Test Case 3:** root = [] → Output: 0
- **Test Case 4:** root = [1] → Output: 1

### 27.3 Algorithm

1. Use recursive DFS:  $\text{max depth} = 1 + \max(\text{left depth}, \text{right depth})$ .
2. Base case: return 0 for None.

**Time Complexity:**  $O(n)$     **Space Complexity:**  $O(h)$  for recursion

### 27.4 Python Solution (Recursive)

```

1 def max_depth(root):
2     if not root:
3         return 0

```

```

4     return 1 + max(max_depth(root.left), max_depth(
5         root.right))
6
7 # Example usage
8 # root = TreeNode(3, TreeNode(9), TreeNode(20,
9     TreeNode(15), TreeNode(7)))
10 # print(max_depth(root)) # Output: 3

```

## 27.5 Python Solution (Iterative)

```

1 def max_depth_iterative(root):
2     if not root:
3         return 0
4
5     queue = deque([(root, 1)])
6     max_depth = 0
7
8     while queue:
9         node, depth = queue.popleft()
10        max_depth = max(max_depth, depth)
11        if node.left:
12            queue.append((node.left, depth + 1))
13        if node.right:
14            queue.append((node.right, depth + 1))
15    return max_depth

```

# 28 Same Tree

## 28.1 Problem Statement

Given two binary trees, check if they are structurally identical and have the same values.

## 28.2 Dry Run on Test Cases

- **Test Case 1:** p = [1,2,3], q = [1,2,3] → Output: True
- **Test Case 2:** p = [1,2], q = [1,null,2] → Output: False
- **Test Case 3:** p = [1,2,1], q = [1,1,2] → Output: False
- **Test Case 4:** p = [], q = [] → Output: True

## 28.3 Algorithm

1. Recursively check:
2. If both None, return True.

3. If one None or values differ, return False.
4. Recurse on left and right subtrees.

**Time Complexity:**  $O(\min(n, m))$     **Space Complexity:**  $O(h)$

## 28.4 Python Solution

```

1 def is_same_tree(p, q):
2     if not p and not q:
3         return True
4     if not p or not q or p.val != q.val:
5         return False
6     return is_same_tree(p.left, q.left) and
           is_same_tree(p.right, q.right)

```

# 29 Symmetric Tree

## 29.1 Problem Statement

Given a binary tree, check if it is mirror symmetric.

## 29.2 Dry Run on Test Cases

- **Test Case 1:** root = [1,2,2,3,4,4,3] → Output: True
- **Test Case 2:** root = [1,2,2,null,3,null,3] → Output: False
- **Test Case 3:** root = [1] → Output: True
- **Test Case 4:** root = [] → Output: True

## 29.3 Algorithm

1. Recursively check left and right subtrees:
2. If both None, return True.
3. If one None or values differ, return False.
4. Compare left.left with right.right and left.right with right.left.

**Time Complexity:**  $O(n)$     **Space Complexity:**  $O(h)$

## 29.4 Python Solution

```

1 def is_symmetric(root):
2     def is_mirror(left, right):
3         if not left and not right:
4             return True

```

```

5         if not left or not right or left.val != right.val:
6             return False
7         return is_mirror(left.left, right.right)
8             and is_mirror(left.right, right.left)
9
10    return is_mirror(root, root) if root else True

```

## 30 Balanced Binary Tree

### 30.1 Problem Statement

Given a binary tree, determine if it is height-balanced (difference in heights of left and right subtrees  $\leq 1$ ).

### 30.2 Dry Run on Test Cases

- **Test Case 1:** root = [3,9,20,null,null,15,7] → Output: True
- **Test Case 2:** root = [1,2,2,3,3,null,null,4,4] → Output: False
- **Test Case 3:** root = [] → Output: True
- **Test Case 4:** root = [1] → Output: True

### 30.3 Algorithm

1. Use DFS to compute height of each subtree.
2. Return -1 if unbalanced, else height.
3. Tree is balanced if root's height  $\neq -1$ .

**Time Complexity:**  $O(n)$     **Space Complexity:**  $O(h)$

### 30.4 Python Solution

```

1 def is_balanced(root):
2     def check_height(node):
3         if not node:
4             return 0
5         left_height = check_height(node.left)
6         if left_height == -1:
7             return -1
8         right_height = check_height(node.right)
9         if right_height == -1 or abs(left_height -
10            right_height) > 1:
11             return -1
12     return max(left_height, right_height) + 1

```

```
13 |     return check_height(root) != -1
```
